Evaluation of Chronic Lymphoproliferative Disorders CLPD.

Importance of flow cytometry in the detection of abnormal cells in small / pauci-cellular samples.

Multiparameter Flow Cytometry, that combines high specificity with good clinical sensitivity results in an extremely efficient method to confirm or exclude the presence of abnormal cells in pauci-cellular samples received in the clinical laboratory, such as CSF or vitreous biopsies.

Example of CSF that resulted positive for involvement by Diffuse large B cell lymphoma (DLBCL)
